R.C	OhdsiWebApi is part of HADES.	

ROndsi wedapi is part of HADES.

1 Introduction

From Package Readme

ROhdsiWebApi is a R based interface to 'WebApi' (OHDSI RESTful services), and performs GET/PULL/POST/DELETE calls via the WebApi. All objects starting from R or output to R - are analysis ready R-objects like list and data.frame. The package handles the intermediary steps by converting R-objects to JSON and vice versa. To ensure r-objects are analysis ready, the objects are type converted where possible, e.g. date/date time are converted from string to POSIXct.

This package makes reproducible research easier, by offering ability to retrieve detailed study specifications, transport study specifications from one instance to another, programmatically invoke the generation of a sequence of steps that are part of a study, manage running studies in batch mode.

This document will attempt to explain how ROhdsiWebApi maybe used to achieve reproducible research.

2 WebApi configurations and ROhdsiWebApi

To successfully use ROhdsiWebApi, it is necessary to have an active 'WebApi' endpoint with a known baseUrl such as "http://server.org:80/WebAPI". 'WebApi' has many functional categories.

To ensure reproducibility of work it is best to know the version of the WebApi (i.e. Atlas backend) being used. An easy way to do that is (and output maybe included in your study results)

The object version will show your webApi version. Example: This Vignette was created using WebApi version: 2.8.0 on baseUrl: https://epi.jnj.com:8443/WebAPI. The CDM had the following source data configured: .

```
cdmSources
#> # A tibble: 40 x 7
#>
      sourceId\ sourceName
                                   sourceKey
                                                       sourceDialect\ cdmDatabaseSchema
                                                                                               vocabDatabas
#>
         <int> <chr>
                                   <chr>
                                                                      \langle chr \rangle
                                                                                               \langle chr \rangle

#> # ... with 30 more rows
```

The priority vocabulary for the WebApi is VOCABULARY_20200320.

We can also perform checks on the WebApi, example - we may want to see if the 'HCUP' & 'SYNPUF1K' is a valid SourceKey in the current webApi.

```
ROhdsiWebApi::isValidSourceKey(sourceKeys = c('HCUP', 'SYNPUF1K'), baseUrl = baseUrl)
#> [1] TRUE FALSE
```

2.1 WebApi Analytical categories.

WebApi maybe considered to have certain modular analytic categories. ROhdsiWebApi supports the following categories:

Category	Features
ConceptSet	Functions for interfacing with ConceptSet in WebApi
Cohort	Functions for interfacing with Cohort in WebApi
IncidenceRate	Functions for interfacing with IncidenceRate in WebApi
Estimation	Functions for interfacing with Estimation in WebApi
Prediction	Functions for interfacing with Prediction in WebApi

Category	Features
Characterization	Functions for interfacing with Characterization in WebApi
Pathway	Functions for interfacing with Pathway in WebApi

${\bf 3}\quad {\bf Framework\ of\ ROhdsiWebApi}$

ROhdsiWebApi maybe better understood by having atleast a high level understanding of CRUD framework for WebApi, i.e. the GET, PUT, DELETE, POST calls to the API. See the documentation of the WebApi.

For each supported category, ROhdsiWebAPi performs GET, PUT, DELETE, POST calls to WebApi in background. The details of what calls are actually performed is less important to an analyst, but it is useful to understand the naming conventions of ROhdsiWebApi.

3.1 Naming conventions of ROhdsiWebApi

Most functions in ROhdsiWebApi start with an action oriented 'verb' - such as

	D 1.1
Function Name	Description
cancel Characterization Generation	Cancel Characterization Generation
cancel Cohort Generation	Cancel Cohort Generation
cancelGeneration	Cancel Generation
cancel Incidence Rate Generation	Cancel Incidence Rate Generation
cancelPathwayGeneration	Cancel Pathway Generation
convert Concept Set Definition To Table	Convert Concept Set Definition To Table
create Concept Set Workbook	Create Concept Set Workbook
deleteCharacterizationDefinition	Delete Characterization Definition

•	

Function Name	Description
postEstimationDefinition	Post Estimation Definition
postIncidence Rate Definition	Post Incidence Rate Definition
postPathwayDefinition	Post Pathway Definition
postPredictionDefinition	Post Prediction Definition
${\bf resolve Concept Set}$	Resolve Concept Set

Most of the functions start with the following verbs:

Function Verb	Number Of Functions
Get	37
Isvalid	9
Delete	8
Post	8
Detect	7
Exists	7
Cancel	5
Invoke	5
Insert	2
Convert	1
Create	1
Resolve	1

A function to get Definition is getDefinitionMetaData function. This is a general function that is able to get the Metadata for all specifications within a category.

```
ROhdsiWebApi::getDefinitionsMetadata(baseUrl = baseUrl,
                                        category = 'cohort') %>%
  arrange(.data$id) %>%
  rename_all(.funs = SqlRender::camelCaseToTitleCase) %>%
  tail()
#> # A tibble: 6 x 7
        Id Name
                                             Description
                                                                                    `Created By` `Created Date
     \langle int \rangle \langle chr \rangle
                                             <chr>
                                                                                   <lql>
                                                                                                 \langle dttm \rangle

                                                                                             2015-05-26 15
                                            <NA>
#> 5 16698 [CDS_Rheum] *1stdx_GCA_2dx_50~
                                            <NA>
                                                                               NA
                                                                                             2015-05-26 15
#> 6 16699 [CDS_Rheum] *1stdx_GCA_2dx_50~
                                            <NA>
                                                                               NA
                                                                                             2015-05-26 15
```

Similar approach may be used for all categories as follows:

```
ROhdsiWebApi::getDefinitionsMetadata(baseUrl = baseUrl,
                                       category = 'estimation') %>%
  arrange(.data$id) %>%
  rename all(.funs = SqlRender::camelCaseToTitleCase) %>%
  tail()
#> # A tibble: 6 x 6
#>
        Id Name

```

This is a generic framework that applies to most WebApi categories, and supports different types of CRUD functionalities like deleteConceptSetDefinition() vs deleteDefinition(category = 'conceptSet').

4 Concept Set

Please review 'Concept sets - The Book of OHDSI'

We commonly post concept set expression into WebApi/Atlas, or try get an expression from Atlas/WebApi based on a conceptSetDefinitionId.

Example: lets say we have concept set expression as follows, that is being used for a Rheumatoid Arthritis study.

```
jsonExpression <- '{
  "items": [
     {
        "concept": {</pre>
```

```
"CONCEPT_ID": 81097,
        "CONCEPT_NAME": "Feltys syndrome",
        "STANDARD CONCEPT": "S",
        "STANDARD_CONCEPT_CAPTION": "Standard",
        "INVALID REASON": "V",
        "INVALID_REASON_CAPTION": "Valid",
        "CONCEPT_CODE": "57160007",
        "DOMAIN_ID": "Condition",
        "VOCABULARY ID": "SNOMED",
        "CONCEPT_CLASS_ID": "Clinical Finding"
      },
      "isExcluded": true,
      "includeDescendants": false,
      "includeMapped": false
    },
      "concept": {
        "CONCEPT_ID": 80809,
        "CONCEPT_NAME": "Rheumatoid arthritis",
        "STANDARD_CONCEPT": "S",
        "STANDARD_CONCEPT_CAPTION": "Standard",
        "INVALID_REASON": "V",
        "INVALID_REASON_CAPTION": "Valid",
        "CONCEPT_CODE": "69896004",
        "DOMAIN_ID": "Condition",
        "VOCABULARY_ID": "SNOMED",
        "CONCEPT_CLASS_ID": "Clinical Finding"
      },
      "isExcluded": false,
      "includeDescendants": true,
      "includeMapped": false
    },
      "concept": {
        "CONCEPT ID": 4035611,
        "CONCEPT_NAME": "Seropositive rheumatoid arthritis",
        "STANDARD_CONCEPT": "S",
        "STANDARD_CONCEPT_CAPTION": "Standard",
        "INVALID REASON": "V",
        "INVALID_REASON_CAPTION": "Valid",
        "CONCEPT_CODE": "239791005",
        "DOMAIN_ID": "Condition",
        "VOCABULARY_ID": "SNOMED",
        "CONCEPT_CLASS_ID": "Clinical Finding"
      },
      "isExcluded": false,
      "includeDescendants": true,
      "includeMapped": false
    }
  ]
}'
```

Lets call this concept set expression - '[ROhdsiWebApi Vignette] Rheumatoid Arthritis concept set'.

```
#> Successfully deleted conceptSet definition id 11374. Request status code: Success: (204) No Content
#> NULL
```

Note: function does not accept JSON. It needs to be converted to R (list) expression

We can post the concept set expression into WebApi as follows:

If successful, we will get a return object as follows into R.

The id of the newly posted concept-set definition is 11375. We can now use this concept-set for many concept set queries eg.,

4.1 if want to print ready expression of the concept set definition

```
conceptSetDefinition = getConceptSetDefinition(conceptSetId = returnFromPostRequest$id,
                                               baseUrl = baseUrl)
conceptTbl <-
  convertConceptSetDefinitionToTable(conceptSetDefinition)
names(conceptTbl) <-</pre>
  SqlRender::camelCaseToTitleCase(names(conceptTbl))
conceptTbl
#> # A tibble: 3 x 13
     `Is Excluded` `Include Descen~ `Include Mapped` `Concept Id` `Concept Name` `Standard Conce~ `Stan
    <lql>
                   <lql>
                                    <lql>
                                                             <int> <chr>
                                                                                  <chr>
                                                                                                    <chr>
#> 1 TRUE
                   FALSE
                                    FALSE
                                                             81097 Felty's syndr~ S
                                                                                                   Stand
#> 2 FALSE
                   TRUE
                                    FALSE
                                                             80809 Rheumatoid ar~ S
                                                                                                   Stand
                                                          4035611 Seropositive ~ S
#> 3 FALSE
                   TRUE
                                    FALSE
                                                                                                   Stand
#> # ... with 5 more variables: `Invalid Reason Caption` <chr>, `Concept Code` <chr>, `Domain Id` <chr>
#> # Id` <chr>
```

createConceptSetWorkbook maybe used to create an Excel workbook of the concept set.

If we want a list of all conceptId's (including descendants) from the concept set expression

```
resolvedConcepts = resolveConceptSet(conceptSetDefinition = conceptSetDefinition, baseUrl = baseUrl)
print("Note: Showing only the first 10 concept id's")
#> [1] "Note: Showing only the first 10 concept id's"
resolvedConcepts[1:10]
#> [1] 80809 4035427 4035611 4103516 4114439 4114440 4114441 4114442 4114444 4115050
```

The concept set expression json expression can be recaptured from WebApi as follows

5 Cohorts/Characterization/Incidence rate

Please review 'What is a cohort - The Book of OHDSI'.

We define a cohort as a set of persons who satisfy one or more inclusion criteria for a duration of time. The term cohort is often interchanged with the term phenotype. Cohorts are used throughout OHDSI analytical tools and network studies as the primary building blocks for executing a research question.

A cohort is defined as the set of persons satisfying one or more inclusion criteria for a duration of time. One person may qualify for one cohort multiple times during non-overlapping time intervals. Cohorts are constructed in ATLAS by specifying cohort entry criteria and cohort exit criteria. Cohort entry criteria involve selecting one or more initial events, which determine the start date for cohort entry, and optionally specifying additional inclusion criteria which filter to the qualifying events. Cohort exit criteria are applied to each cohort entry record to determine the end date when the person's episode no longer qualifies for the cohort.

Cohorts/Characterization/Incidence Rate are WebApi categories, where WebApi manages the execution of generations.

Example: We may want to know if a certain cohort specification has been generated by checking cohort generation status getCohortGenerationInformation(baseUrl = baseUrl, cohortId= 4234). If a cohort is not previously generated, it may be generated using invokeCohortSetGeneration(baseUrl = baseUrl, cohortId = 4234, sourceKey = 'HCUP'). If it is already generated, we can extract its output of cohort generation using getCohortResults(baseUrl, cohortId = 4234).

6 Characterization

Please review 'Characterization - The Book of OHDSI'.

7 Population Level Effect Estimation

Please review 'Population Level Effect Estimation - The Book of OHDSI'.

8 Patient Level Prediction

Please review 'Patient Level Prediction - The Book of OHDSI'.
